

How to enable delivery notification on sent messages

In this how to we are going to install sent notifications script for sent SMS messages.

The notification or report, is a SMS that the air carrier will send back to you to notify you the delivery status of your previous sent SM message. This is a common feature when you need to be 100% sure that a SMS has reached the destination.

To enable this feature you have simply to copy the content of the zip file REPORT_FOXBOX into the foxbox /mnt/flash/ folder using FTP or SSH with user root and password pass.

Once the folder REPORT_FOXBOX will be copied change to directory (cd /mnt/flash/REPORT_FOXBOX) and launch ./install.sh, to place the needed files inside the right paths. Then, reboot the appliance with the reboot command.

WARNING: This script will replace all your custom scripts and eventhandler configurations, backup it before proceed.

Once the system will be installed, send an SMS, you should receive a notification message in the /var/spool/report folder with the some name as the sent message. Use it to apply a check to your scripts.
